POLISHING POWDER

FORMULATED FOR

ALL CALCITE-BASED
STONES & TERRAZZO

EASY TO USE
Wet Polish
Will Not Etch

MB-22
FOR PROFESSIONAL USE ONLY

**POLISH TO
A DEEP GLOSS**

MB-22 Polish is an awesome wet polish powder that will not etch surfaces with splatter. Formulated for calcite - based stones and terrazzo. The following directions are an average recommendation. Different stones may require different quantities of product along with various techniques.

APPLICATION:

All Calcite-Based Stones & Terrazzo

1. Make sure the surface is free of any coatings, waxes, sealers, grease and/or soil.
2. If the surface requires honing use quality diamonds and hone surface correctly predicated upon the clarity of the stone being worked on.
3. Use about a 1/3 oz per 2-3 SF (remember the amounts will vary) of product and enough water to create a wet paste, but thick enough not to make a splattering mess.
4. Start by placing the product in the center of your target.

COUNTERS:

Add the water now. Place your machine and hog's hair or white pad directly on top of it. Starting slowly spread the product out over the area. The use of pressure will vary depending on the stone but generally you can apply an even light pressure. Run the machine on a slow setting for about a minute per sq. ft.

FLOOR:

Drop about 5 seconds of water. Run machine over the area for approximately 3-4 minutes per 10 to 12 sq. ft.

5. Check the results and repeat if needed. If you want more luster run for another minute. When you are satisfied, move on to the next area.
